TECHNICAL SPECIFICATIONS

Frequency range	3-20,000 Hz ±0.3 dB
Signal-to-noise ratio	>96 dB/100 dB A-weighted
Dynamic range	>96 dB
Harmonic distortion	<0.003% at 0 dB
	<0.03% at -20 dB
Channel separation	>94 dB
Channel difference	<0.5 dB
Converter system	16 bit, 4 x oversampling 176.4 kHz
Low pass filter	Digital + bessel analog
Damping >20,000 Hz	>50 dB
Phase error	±0.5 degree at 20-20,000 Hz
Output	2 V RMS at 0 dB
Power supply	Type no. 5141: 220 V
	Type no. 5142: 240 V
	Type no. 5143: 120 V
	Type no. 5144: 100 V
	Type no. 5145: 240 V
Power frequency	50-60 Hz
Power consumption	30 watts
Dimensions W x H x D	42 x 7.5 x 31 cm (16½" x 3 x 12¼")
Weight	4.9 kg (10.8 lbs)

Subject to change without notice

DIAGRAMFORKLARING

På diagrammet er der angivet typenumre på transistorer og IC'er i de tilfælde hvor typenummeret er entydigt for komponentens placering i kredsløbet – f.eks. TR20/BC 557B.

Hvis positionsnummeret er efterfulgt af en stjerne **skal** reservedelsnummeret benyttes, da denne komponent er specielt udvalgt – f.eks. TR102*.

Ledningsforbindelser
Ledningsforbindelserne på diagrammet er samlet i »bundter«. De enkelte ledninger er forsynet med koder, der fortæller hvortil de går.

INTERN FORBINDELSE
PÅ EN DIAGRAMSIDE

Interne forbindelser på en diagramside angives med et tal. Knækket på ledningen viser i hvilken retning den anden ende af ledningen findes.

FORBINDELSE TIL EN ANDEN
DIAGRAMSIDE
Forbindelsen til en anden diagramside angives med et tal, samt bogstav indikation på det diagram forbindelsen går til.

Forsyningsspændinger
En pil og spændingen viser, hvor forsyningsspændingerne går ind i et print.

Eksempel: Ved siden af forsyningsspændingen står f.eks. 7 CON. Det betyder at denne pil, og dermed forsyning går til 7 steder på denne diagramside (7 CON. = 7 connections).

Symbol for sikkerhedskomponenter

Ved udskiftning af komponenter med dette symbol skal der anvendes komponenter med samme reservedelsnummer. Den nye komponent skal monteres på samme måde som den udskiftede.

EXPLANATION OF DIAGRAM

Type numbers of transistors and IC's have been indicated on the diagram in those cases where the type number is unambiguous for the position of the component in a circuitry – e.g. TR20/BC 557B.

If the position number is followed by an asterisk the spare part number **must be used** because this component has been expecially selected – e.g. TR102*.

Wiring Connections
The wiring connections on the diagram are assembled in "bundles". The individual wires are coded to indicate to where they are leading.

INTERNAL CONNECTION
ON ONE DIAGRAM PAGE

```
  |      |              |      |
  12     20             20     12
```

Internal connections on a diagram page are indicated by a number. The bend of the wire indicates in which direction the other end of the wire may be found.

CONNECTION TO ANOTHER
DIAGRAM PAGE

```
     DIAGRAM A          DIAGRAM C
      |    |             |     |
      C3   C32           A32   A3
```
Connections to another diagram page are indicated by a number, as well as by a letter of the diagram to which the connections lead.

Supply Voltage
An arrow and the voltage show where the supply voltages are fed to a PCB.

Example: Next to the supply voltage it says e.g. 7 CON. This means that this arrow, and thus the supply goes to 7 different places on this diagram pages (7 CON. = 7 connections).
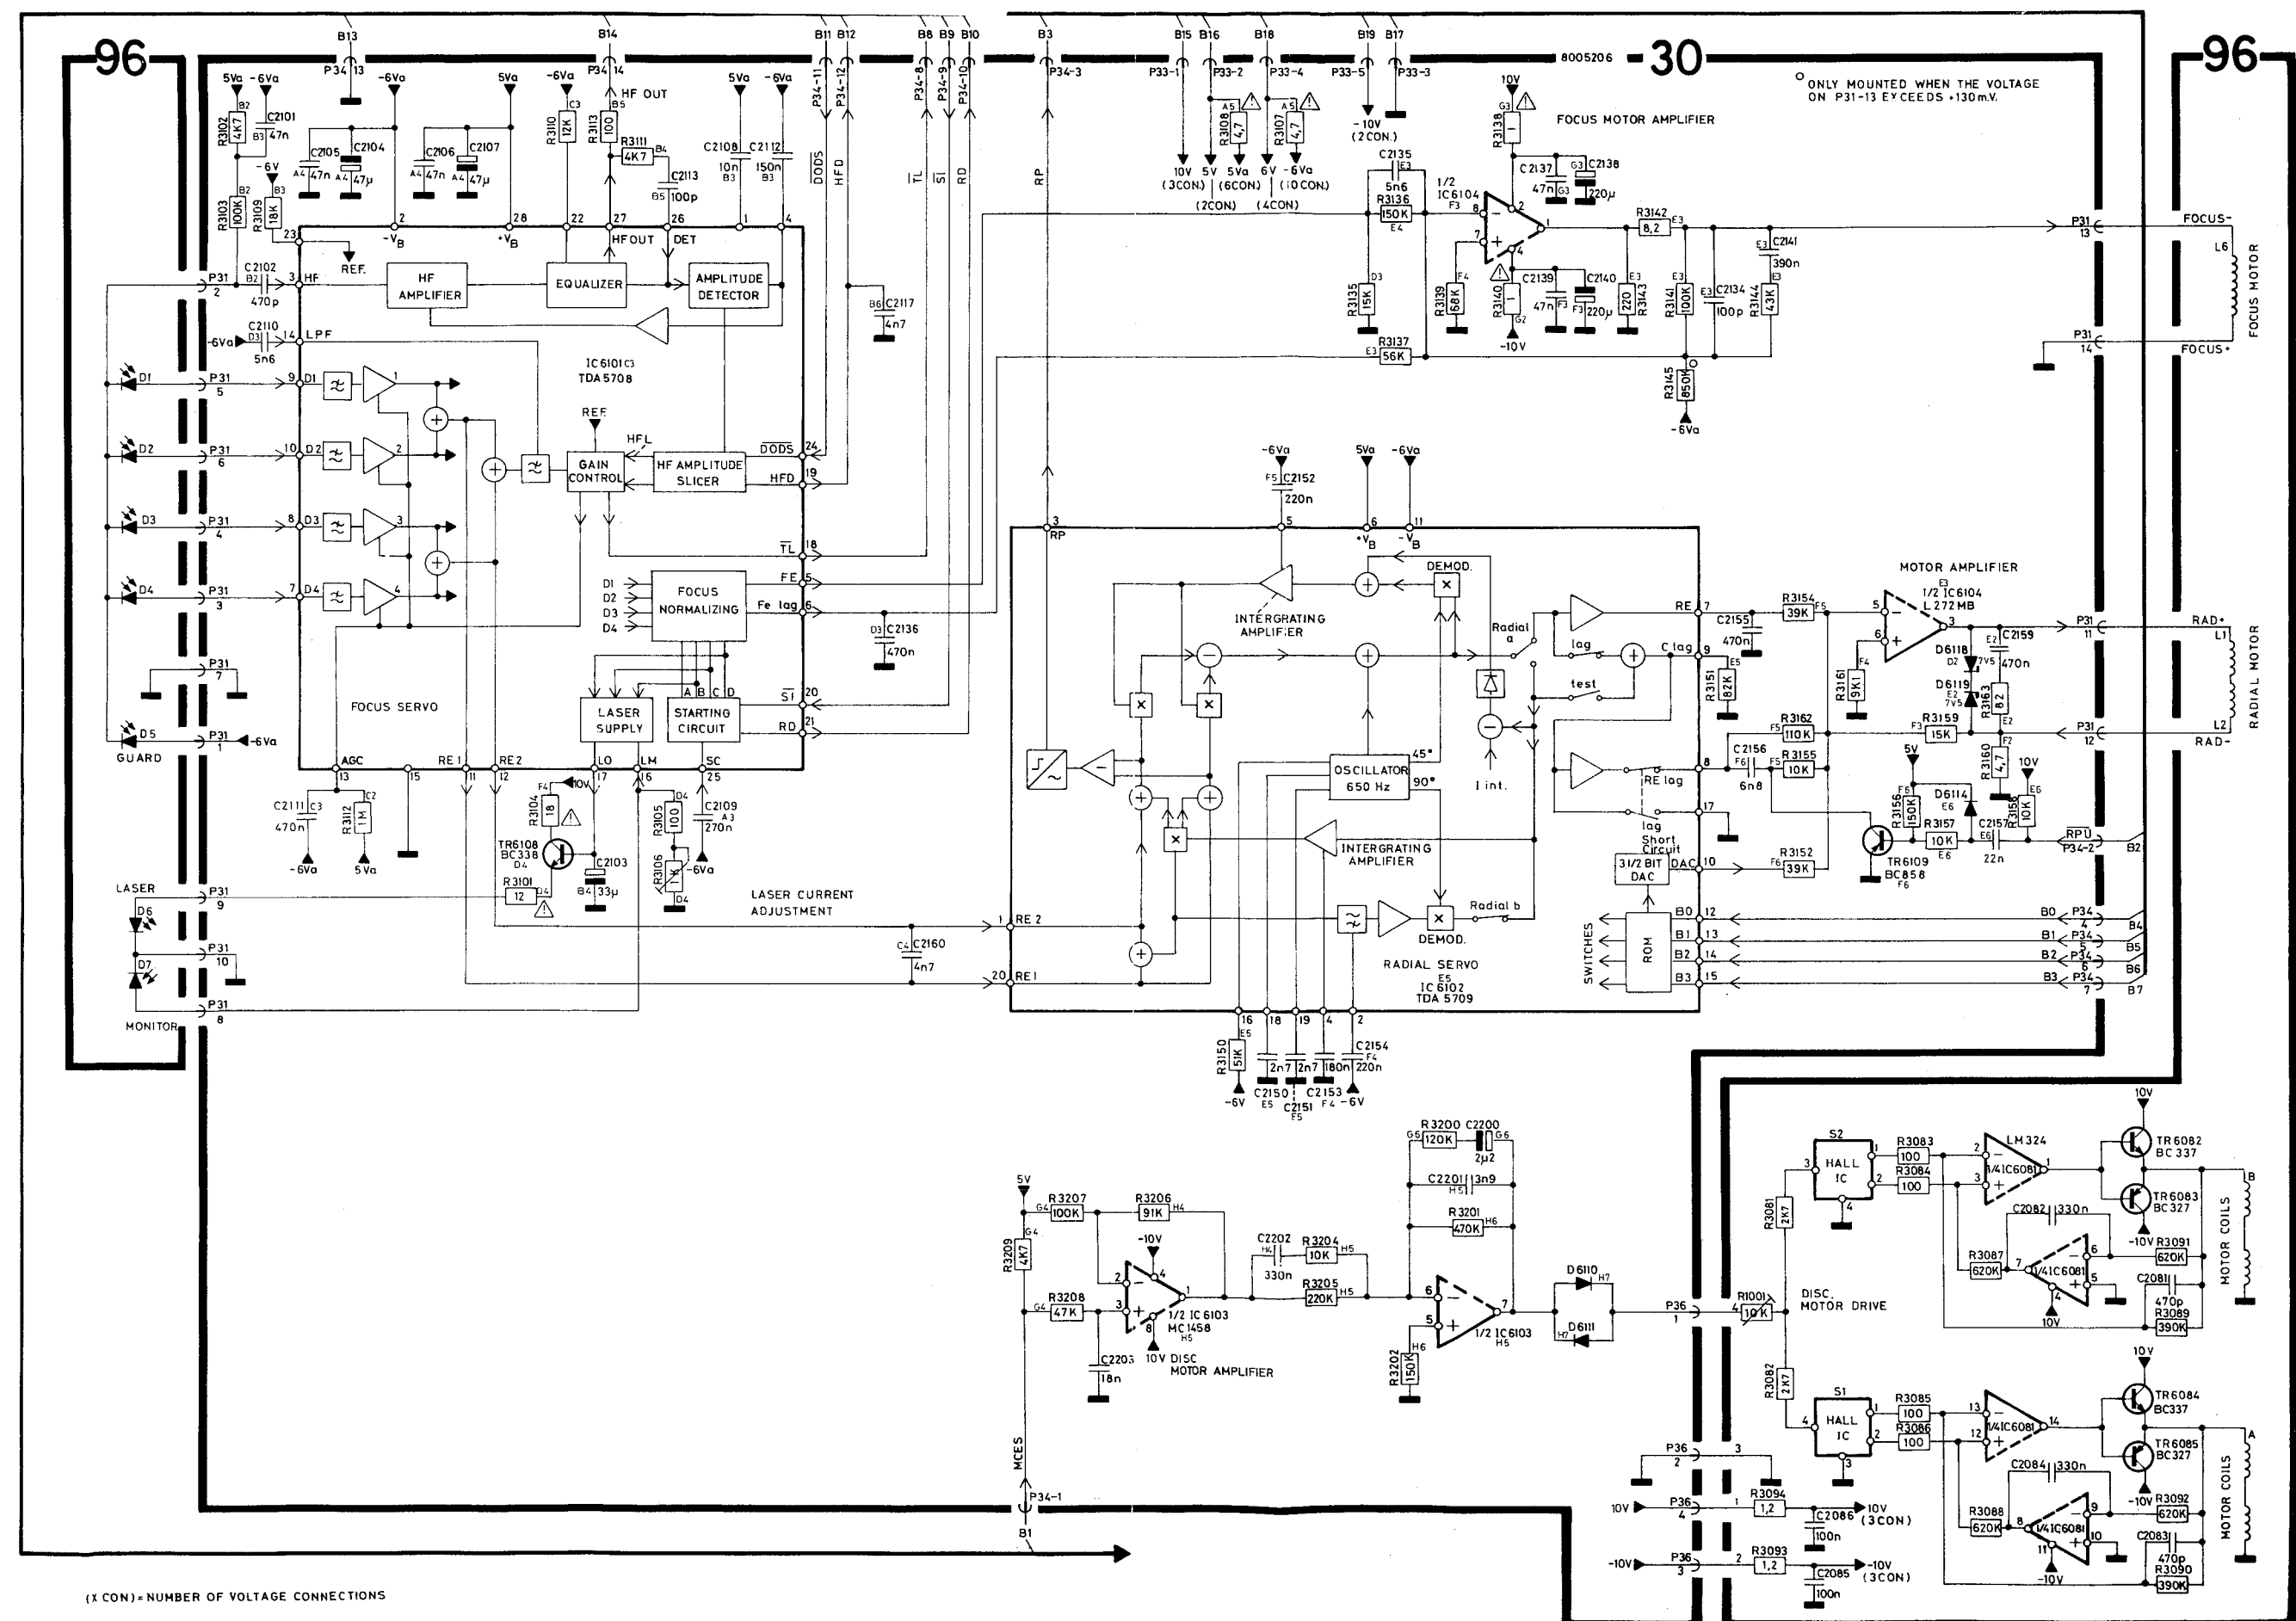

Symbol for Safety Components

When replacing components with this symbol components with identical part numbers are to be used. The new component must be fitted in the same way as the one replaced.

For Servo PCB with Focus off-set Adjustment

DIAGRAM A (Servo and Disc Motor System) see page 9-1.

DISC MOTOR CONTROL

(diagram)
KONTROL, REPARATION OG JUSTERING AF CD LØBEVÆRK

For at forhindre metalsplinter i at komme ned i løbeværket, er det nødvendigt at reparationspladsen er helt ren.

PHOTODIODERNE OG LASEREN ER MERE FØLSOMME OVERFOR STATISK EL END MOS IC'er. UFORSIGTIG BEHANDLING UNDER SERVICE KAN REDUCERE LEVETIDEN DRASTISK. DERFOR SKAL DET SIKRES AT ARBEJDSPLADSEN ER BESKYTTET MOD STATISK EL.

Ved reparation af løbeværket skal der udvises forsigtighed for at undgå beskadigelse af focus bladfjederen.

Servicering af RAFOC enheden (= Radial og Focus enhed, pos. nr. 9605, se exploded view).

Tag CD løbeværket med servo PCB30 ud af apparatet.

Afmonter det fleksible print fra P31 på servo PCB30 ved at trække den øverste del af stikket op, og tage det fleksible print ud.

De 4 skruer, som holder servo PCB30, skrues af.

Servo PCB'en kan nu tages af. RAFOC enheden kan tages ud ved at løsne de 2 M3 x 25 fastspændingsskruer.

Bemærk: Når de nævnte skruer løsnes, er de 2 møtrikker på oversiden af løbeværket løse. Armlejet pos. 9610 trækkes ud, og RAFOC enheden med det fleksible print kan nu tages ud.

BEMÆRK! Ved montering af RAFOC enheden, er det meget vigtigt, at det fleksible print ligger helt op mod topchassiset på CD løbeværket, der hvor holder pos. 9601 skal holde printet fast. For at forhindre at RAFOC enheden kan gå imod det fleksible print, kan det være nødvendigt at lime printet fast mod topchassiset med hurtig tørrende lim. Dette skal dog gøres meget forsigtigt. Hvis laser eller monitor diode er defekt, er det nødvendigt at skifte RAFOC enheden pos. 9605. Efter montering af RAFOC enheden skal det sikres, at enheden kan bevæges helt frit gennem hele vandringen. Dette kan kontrolleres med en trykfjedermåler, som holdes imod magneten på fokusenheden. Friktionen skal være under 25 mN gennem enhedens hele vandring.

CHECK, REPAIR AND ADJUSTMENT OF THE CD MECHANISM

To prevent loose metal objects from getting in the CD mechanism, it will be necessary to see to a clean repair station.

THE PHOTODIODES AND THE LASER ARE MORE SENSITIVE TO ELECTROSTATIC DISCHARGES THAN MOS ICS. CARELESS HANDLING DURING SERVICING MAY REDUCE LIFE EXPECTATION DRASTICALLY. THEREFORE, CARE SHOULD BE TAKEN, THAT THE REPAIR STATION IS PROTECTED AGAINST STATIC ELECTRICITY.

When effecting repairs to, or making measurements on the CD mechanism, be careful not to damage the flat springs of the focusing unit.

Servicing the RAFOC unit (= Radial and Focusing unit, pos. 9605. See exploded view).

Take the CD-mechanism and servo PCB30 assembly out of the set.

Remove the flexible PCB from connector P31 on the servo PCB by lifting the upper part of the connector and taking the flexible PCB out.

Undo the 4 screws on the conductor-side of the servo PCB30.

The servo PCB can now be removed. The RAFOC unit can be removed after the two fixing screws M3 x 25 have been loosened.

Caution: when doing so, the two nuts M3 on the upper side of the CD mechanism come loose. Now the pivot plate pos. 9610 can be removed. After removing the clamping piece, pos. 9601 the RAFOC unit/flexible PCB assembly can be taken out.

ATTENTION: when mounting the RAFOC unit, see to it that the flexible PCB rest well against the mounting plate at the height of the clamping piece (pos. 9601). In some cases, after exchanging the RAFOC unit/flexible PCB assembly, it may be necessary to glue the flexible PCB with a fast-drying glue to prevent the RAFOC unit from rubbing against the flexible PCB. The gluing should be done very carefully. When the laser and/or the monitor diodes are defective, it will be necessary to replace the RAFOC unit, pos. 9605. After mounting the RAFOC unit you should make sure that the arm runs clear over the entire disc diameter. This can be checked by means of a spring-pressure gauge which is held against the magnet of the focusing unit. The friction of the arm, measured over the entire meter reading, may not be greater than 25 mN.

En hurtig kontrol af RAFOC enhedens frigang kan gøres i service position 1, hvor enheden kan bevæges gennem hele vandringen med << og >> tasterne. (Se servicetips side 7.1).
Efter montering af RAFOC enheden skal laserarmens vinkelindstilling kontrolleres. Playability efter montering af RAFOC enheden kan afprøves med test-plade 5A.

A fast check of the clearance of the arm is possible in service position 1. The RAFOC unit can be moved across the diameter of the disc by operating the SEARCH FORW. and REV. keys. (See servicetips page 7.1).
After mounting the RAFOC unit the angle setting of the laser arm should be checked.
Playability after mounting the RAFOC unit can be checked using test disc 5A.

Udskiftning af servo PCB30, RAFOC enhed pos. nr. 9605 eller focus enhed pos. nr. 9602
Ved udskiftning af en af de nævnte dele, skal følgende kontrolleres:
Tilslut DC voltmeter med + til 30P31 ben 13 og - til 30P31 ben 14 (stel).

Replacing the servo PCB30, RAFOC unit pos. no. 9605 or focusing unit pos. no. 9602
When replacing one of the mentioned parts, the following shall be checked:
Connect DC voltmeter with + to 30P31 pin 13 and - to 30P31 pin 14 (ground).

Hvis der er monteret en 820 kohms modstand fra ben 8 på 30IC6104 til -6 Va, afmonteres denne.

If a resistor of 820 kohms is mounted from pin 8 of 30IC6104 to -6 Va, this should be dismounted.

Ilæg testplade 5 (bestillingsnr. 3634031) og sæt apparatet i serviceposition 2 ved at kortslutte ben 4 på 36IC6078 til stel, samtidig med netstikket sættes i.

Put test disc 5 (part no. 3634031) on the turntable, and put the player in service position 2. (Short circuit pin 4 of 36IC6078 to ground, while plugging in the mains plug).

Tryk ADVANCE 2 gange.

Then press Advance twice.

Hvis spænding overstiger +130 mV monteres 820 kohms modstanden fra ben 8 på 30IC6104 til -6 Va.

If the voltage measured, exceeds +130 mV, the resistor of 820 kohms shall be mounted from pin 8 of 30IC6104 to -6 Va.

Kontrol af vinkel indstilling på laserarm

Vinkel indstillingen kan kontrolleres efter glasplade-metoden, som er forklaret i det efterfølgende.

Checking the angle setting

The angle setting can be checked with the glass-disc method which is explained below.
Læg glasplade (bestillingsnr. 3634030) på pladeholde-ren. Glaspladen skal hvile jævnt mod pladeholderen.

Placer CD løbeværket under en lyskilde hvorunder der er en lige linie (f.eks. et lysstofrør med gitter).

Placer laserarmen midt i dens radiale vandring.

Drej løbeværket indtil laserarmen er parallel med linien fra lyskilden.

Se i forlængelse af den reflekterede linie på henholds-vis glasplade og optik. Der må ikke være mere end 4 mm afstand mellem de 2 linier.

Placer CD løbeværket sådan at linien der reflekteres af optikket løber gennem optikkets centrum.

Hvis linien der reflekteres af glaspladen er indenfor optikkets overfalde, er vinkel indstillingen i orden.

Put glass disc part no. 3634030 on the turntable. Male sure that the glass disc beds down well on the turntable.

Place the CD mechanism under a light source, under which there is a straight line (e.g. under a fluorescent tube with grid).

Set the arm to mid-position of its radial track.

Turn the mechanism until the arm is parallel to the line under the light source (see figure below).

Look into the direction and in the extension of the line to the reflection there of on the glass disc and in the objective. These lines should not be apart more than 4 mm.

Place the CD mechanism so that the reflected line runs across the centre of the objective.

When the line that is reflected by the glass disc stays within the surface of the objective, the angle setting is correct.

OBJECTIVE
DISC (TRANSPARENT)
Drej CD løbeværket 90° i forhold til forrige position.	Turn the CD mechanism through 90° relative to the previous position.
Hold laserarmen i midterposition.	The arm must be kept in mid-position (see figure above).
Gentag ovenstående kontrol.	Repeat the previous check.

Justering af vinkel indstilling

Hvis kontrol af vinkel indstilling viser, at vinklen er udenfor tolerance, skal den *ikke* justeres til minimum afvigelse men blot indenfor tolerance.

Efter justering af vinkel indstilling, skal laserarmens friktion kontrolleres. Dette kan gøres med en tryk-fjedermåler, som holdes mod magneten på focus-enheden.

Friktionen skal være under 25 mN gennem enhedens hele vandring.

Hvis friktionen er for høj skal RAFOC enheden udskiftes og vinkel indstillingen skal kontrolleres igen.

Adjusting the angle setting

If a check on the angle setting shows that the angle falls outside the toelerance, the angle should *not* be adjusted for minimum deviation, but it should be adjusted within the tolerance.

After adjusting the setting, the friction of the arm must be checked. This is done by means of a spring pressure gauge which is held against the magnet of the focusing unit.

The friction of the arm, measured over the entire meter reading, should not be greater than 25 mN.

When the friction appears to be too high, the RAFOC unit must be replaced and the angle setting shall be checked once more.

Justering af vinkel indstilling gøres som beskrevet i det efterfølgende:

Adjustment of the angle setting is performed as follows:
Skruerne C løsnes indtil armlejet D kan forskubbes. Vinkelindstillingen justeres ved at skubbe armlejet D som vist på nedenstående tegning.

Loosen screws C (see figure above) until bearing plate D can be displaced. Correct the angle setting by moving the bearing plate into the direction shown in figure below.

Skruerne C spændes medens det sikres at indstillingen ikke flytter sig.

Tighten screws C, ensuring that the setting does not drift.

Foretag kontrol af vinkelindstilling.

Then double check the setting in two directions.

Bang&Olufsen

5-6
Udskiftning af fleks PCB pos. 9607
Afmonter RAFOC enheden.

De 2 tilslutninger A kan nu loddes fra, og før tilslutningerne C loddes fra, skal placeringen af fleks-PCB'en markeres på fotodiode PCB'en.

Dette gøres ved hjælp af en blyant, så den nye fleks-PCB kan placeres i nøjagtig samme position.

Replaceing the flexible PCB pos. 9607
Demount the RAFOC unit.

Desolder the connections A of the flexible PCB.

Before desoldering the connections C of the photodiode PCB, the position of the connecting points of the photodiode PCB should be marked, so that afterwards the PCB can correctly be replaced.
Fralodningen af de 6 tilslutninger C skal gøres ved at varme hver enkelt tilslutning op og løsne forbindelsen med f.eks. bagkanten af et skalpelblad.
N.B. Dette skal gøres med stor forsigtighed.
Herefter fraloddes de 4 tilslutninger til radial spolerne inden de 3 tilslutninger (B) til laser PCB'en loddes fra.

PCB'en kan nu løftes af, og inden den nye PCB monteres, loddes et lille lag loddetin på tilslutningerne C.

Den nye fleks-PCB placeres nu korrekt i.flg. blyantensmærkerne og tilslutningerne til de radiale spoler loddes nu fast inden tilslutningerne A og B.

PCB'en placeres på plads under fotodioden PBC'en, og hver enkelt tilslutning varmes let op med en loddekoble, til lodningerne løber sammen.

For montering af RAFOC enheden, se afsnittet om servicering af RAFOC enhed.

Now the 6 connections C of the photodiode PCB can be desoldered by heating the pins C one by one until the flexible PCB comes loose.
This should be done very carefully.
Desolder the 4 connections of the radial coils.
Unsolder the 3 connections (B) of the laser PCB.

The PCB can now be taken off, and before the new PCB is mounted, the connections C should be provided with a small coating of tin.

The new PCB is now placed according to the marks on the photodiode PCB, and the 4 connections of the radial coils are soldered before the connections A and B.

Now the PCB is placed correct below the photodiode PCB, and the 6 connections C can now be heated so that they become soldered to the photodiode PCB.

For mounting the RAFOC unit, see section concerning servicing the REFOC unit.

Udskiftning af focus enhed pos. 9602
De 2 tilslutninger fra fleks PCB'en til focus enheden loddes fra.

Skruen der holder focus enheden skrues ud. Bemærk, gevindstykket (pos. 9604) vil gå løs.

Focus enheden kan nu tages af.

Ved montering af ny focus enhed er placeringen fikseret, og justering er ikke mulig.

Replacing the focusing unit pos. 9602
Desolder the 2 connections of the flex PCB on the focusing unit.

Remove the screw fastening the focusing unit. As a result the fixing piece (pos. 9604) will come loose.

The focusing unit can now be removed.

When mounting the new focusing unit the position is fixed, adjustments are not possible.

Kontrol af laserforsyning

Laseren, laserforsyningen i 30IC6101 og monitordioden danner et tilbagekoblings system. En fejl i laserforsyningen kan medføre at laseren ødelægges.
Hvis dette er tilfældet, og laseren (= komplet RAFOC enhed) udskiftes, vil den nye laser også ødelægges.

Da det er umuligt at kontrollere og reparere et tilbagekoblingssystem hvor en af komponenterne mangler, kan nedenstående kredsløb bruges til at kontrollere laserforsyningen.

Den grønne LED udgør laseren. Spændingen over 18 ohms modstanden udgør monitor tilbagekoblings spændingen. 33 ohms modstanden og omskifteren gør det muligt at ændre strømforbruget fra laserforsyningen.

Check of laser supply

The laser and the laser supply in 30IC6101 plus the monitor diode form a feedback system. A defect in the laser supply may result in the destruction of the laser.
If, in that case, the laser (= complete RAFOC unit pos. no. 9605) is replaced, the new laser will also become defective.

However, it is impossible to check and repair a feedback system if a link is missing. For this reason the laser supply can be checked with the circuit below.

The green LED replaces the laser, the voltage across the 18-Ohm resistor is fed back as monitor voltage, the 33-Ohm resistor and the switch serve to draw more current from the laser supply.
Grøn LED f.eks. CQY94 bestillings. nr. 8330054.

Fleks printet tages ud af P31 på servo PCB'en.

Ovenstående kredsløb loddes på P31 på servo PCB'en.

SI (ben 20 på 30IC6101) kortsluttes til stel.

Når SI (Start initialization) er low, kan laserforsyningen tændes i service position 1, ved at kortslutte 36IC6078 ben 4 til stel, samtidig med netstikket sættes i. Tryk derefter ADVANCE.

LO spændingen på 30P31 ben 9 måles.

S1 afbrudt: LO fra 1,8 V til 2,3 V
　　　　　LM fra 180 mV til 220 mV
　　　　　Den grønne lysdiode lyser svagt.

S1 kortsluttet: LO fra 1,8 V til 2,3 V
　　　　　LM fra 170 mV til 220 mV
　　　　　Den grønne lysdiode lyser svagt.

Når S1 skiftes fra kortsluttet til afbrudt vil LED'en lyse kraftigere i et kort øjeblik. Tilbagekoblingssystemet bevirker at der går samme strøm i LED hvadenten S1 er kortsluttet eller afbrudt.

LED green e.g. CQY94 part no. 8330054.

Take the flex PCB out of P31 on the servo PCB.

Connect above mentioned circuit to P31 on the servo PCB.

Connect SI (pin 20 of 30IC6101) to ground.

With SI (start initialization) low, the laser supply can be switched on by short circuit pin 4 of 36IC6078 to ground, while plugging in the mains plug.
Then press ADVANCE.

Measure the voltage LO at 30P31 pin 9.

S1 open: LO from 1.8 V til 2.3 V
　　　　LM from 170 mV to 220 mV
　　　　The green LED emits little light.

S1 closed: LO from 1.8 V to 2.3 V
　　　　LM from 170 mV to 220 V
　　　　The green LED emits little light.

During the change over from S1 closed to S1 open, the LED will emit more light for a short moment.
The control sees to it that the same amount of current flows through the LED when S1 is open and when S1 is closed.

Justering af laserstrøm

Bemærk! Ved udskiftning af RAFOC enheden (pos. nr. 9605) skal laser current potentiometeret (pos. nr. 30R3106) stilles i mekanisk midt position for at undgå beskadigelse af laseren.

Tilslut DC voltmeter over 30R3102.

Ilæg testplade nr. 5 (plade uden fejl, bestillingsnr. 3634031).

Sæt apparatet i serviceposition 2. (Kortslut 36IC6074 ben 4 til stel, samtidig med netstikket sættes i.
Tryk derefter ADVANCE 2 gange, (displayet skal vise F.2).

Juster 30R3106 indtil spændingen over 30R3102 er ca. 40 mV.
(Spændingen varierer hvis pladen roteres).

Gå ud af serviceposition 2 ved at afbryde netspændingen kortvarigt.

Afspil spor 1 på testplade 5.

30R3106 justeres indtil spændingen over 30R3102 er 50 mV ±5 mV.

Adjusting the laser current

Attention: When exchanging the RAFOC unit (pos. nr. 9605), the laser output potentiometer (pos. nr. 30R3106) should be placed in mechanical mid-position to avoid damage to the laser.

Connect CD voltmeter across 30R3102.

Put test disc no. 5 (disc without defects part no. 3634031) on the turntable.

Put the player in service position 2. (Short circuit pin 4 of 36IC6078 to ground, while plugging in the mains plug.
Then press ADVANCE twice, (display shall show F.2).

Adjust 30R3106 until the voltage across 30R3102 is about 40 mV.
(This voltage varies when the disc is rotated).

Leave service position 2 by switching of the mains briefly.

Play track 1 of test disc 5.

Adjust 30R3106 until the voltage across 30R3102 is 50 mV ±5 mV.

Kontrol af disc motor systemet

1. Afbryd Vc forbindelsen ved at lodde 30D6110 og 30D6111 fra.

2. Tilslut den ene kanal på et dobbelt strålet oscilloskop til emitteren på 96TR6082, og den anden kanal til emitteren på 96TR6084. Indstil oscilloskopet til 2V – 10 mS.

3. Sæt apparatet i serviceposition 1 ved at kortslutte ben 4 på 36IC6078 til stel, samtidig med netstikket sættes i.
Tryk derefter ADVANCE 1 gang.

4. Tilslut en negativ DC spændingsforsyning (V-in) til 30P36-1. NB! Apparatet *skal* stå i service position 1 (strømforsyningen i apparatet skal være tændt) når dette gøres.

   Start fra 0 V og reguler DC forsyningen mod – indtil motoren kører (max. -5 V).

   Når motoren kører, ændres spændingen til -1,5 V.

   Motoren skal stadig køre.

Check of disc motor system

1. Interrupt the Vc connection by desoldering 30D6110 and 30D6111.

2. Connect channel A of a dual-beam oscilloscope to the emitter of transistor 96TR6082 on the motor PCB and channel B to the emitter of transistor 96TR6084. Position of the oscilloscope: 2 V/div – 10 ms/div.

3. Put the player in service position 1, by short circuit pin 4 of 36IC6078 to ground, while plugging in the mains plug.
Then press ADVANCE once.

4. Inject a *negative* voltage (V-in) to pin 1 of 30P36. This voltage *may only* be injected *after* the player is put in service position 1. (The power supply in the player must be ON).

   Start from 0 V and lower this voltage fast until the motor is running (max. -5 V).

   When the motor is running, the voltage can be reduced to -1.5 V.

   The motor should keep on running.

5. Sinus signaler (V-out) skal nu være synlige på oscilloskopet. Efter ca. 2 sek. skal signalerne ligge symmetrisk omkring 0 V, og være 90° faseforskudt (se tegning).
Størrelsesforholdet mellem de 2 signaler må højst være 1:2.

5. Now sinusoidal signals (v-out) should be present on the oscilloscope (see figure) which, after about 2 seconds, lie symmetrically round the 0-axis and have shifted 90° in phase relative to one another. The amplitudes of these 2 signals have a maximum permissible ratio of 1:2.
6. Amplituden er afhængig af størrelsen af den tilførte DC spænding.
Forholdet V-in/V-outpp skal ligge mellem 1:2 og 1:3.

6. The amplitude is dependent on th injected voltage. The ratio V-in/V-outpp should lie between 1:2 and 1:3.

7. DC spændingsforsyningen (V-in) ændres indtil motoren kører 600 omdr. min. (V-out frekvens = 30 Hz).
V-in skal ligge mellem -1,5 V og -3,7 V med 600 omdr. min.

7. Now adjust V-in until the motor rotates 600 r.p.m. At 600 r.p.m. the frequency of V-out is 30 Hz. V-in should lie between -1.5 V and -3.7 V at this speed.

8. Mål med oscilloskop, først over 96R3094, og derefter over 96R3093 på disc motor control PCB'en. De 2 stråler på et dobbelt strålet oscillosckop *må ikke* tilsluttes over de 2 modstande samtidig, da forsyningsspændingerne ellers kortsluttes.
Spændingsforsyningen reguleres, indtil der ses 3 pulser med oscilloskopet på 100 mS. (se tegning).

8. Measure with an oscilloscope first across 96R3094 and hereafter across 96R3093 on the disc motor PCB. DO not measure across both resistors at the same time, as this will cause short circuit of the power supplies.
Now adjust the injected voltage in such a way that 3 complete pulses are visible during 100 mS. (See figure).
Oscilloskopet polariseres sådan, at pulserne vender som vist.

The polarity of the oscilloscope must be chosen so that the tops of the pulses are in upward position.

Bang&Olufsen

9. DC spændingsforsyningen reguleres til -1,7 V ±0,5 V på P36-1 på servo PCB'en.

Reference spænding over R3094 = 56,4 mVpp.
Reference spænding over R3093 = 58,8 mVpp.
Hvis forskellen på de 2 spændinger er større end 6 mV, når spændingerne er lavere end reference værdierne, er motoren defekt.

10

9. Adjust the injected voltage until -1.7 ±0.5 V are present on pin 1 of P36 on the servo PCB.

Reference voltage across 96R3094 = 56.4 mVpp.
Reference voltage across 96R3093 = 58.8 mVpp.
If the difference of the 2 voltages exceeds 6 mV, while the voltages are below the reference values, the motor is defect.

10
Toppen må højest variere 24 mV i amplitude.
Flanken må højest variere 36 mV i amplituden.

Top difference must not exceed 24 mVpp amplitude.
Flank difference must not exceed 36 mVpp amplitude.

11. Eksempler på pulsformer som er udtryk for fejl i disc motor systemet.

11. Examples of wave forms when the disc motor system is faulty.
12. DC spændingsforsyningen reguleres til -1,5 V på P36-1 på servo PCB'en.
Motoren skal stadig køre.
Pulsens amplitude falder, men pulsformen skal stadig være symmetrisk og afrundet.

12. Adjust the injected voltage until -1.5 V are present on pin 1 of P36 on the servo PCB.
The motor should keep on running
The amplitude of the pulse will be lower, but the wave form has to be symmetrical and rounded.

Konklusion:

Hvis ovennævnte punkter kan opfyldes, er disc motor systemet i orden.

Conclusion:

When all above mentioned conditions are fulfilled it may be assumed that the disc motor system is all right.

17	LO (Laser Out).	»High«	»Low«	»High«	»High«	»High«	»High«
16	LM (Laser Monitor) Via LM styres strømforsyningen til laser dioden. Via the LM the power supply for the laser diode is controlled.	200 mV ±50 mV		200 mV ±50 mV			
5	FE (Focus Error). FE styrer focus enheden. Når SI går »high« søges der efter focus punktet. Når apparatet sættes i serviceposition 2 uden plade, vil optikket søge efter focus punktet. På ben 5 vil FE signalet variere mellem 0 V og +4 V. FE drives the focusing unit. When the SI goes 'high', the focal point will be searched for. When the player is brought into servicing position 2 without disc, the objective will search for the focal point. At pin 5 the FE signal varies between 0 V and +4 V.						
9 10 8 7	D1 D2 D3 D4 D1→D4 er korrektionssignaler for fotodiode kredsløbet. Hvis pladen bevæges når apparatet er i serviceposition 2, skal focusenheden holde focus. Når pladen bevæges, skal der være varierende signaler på ben 7, 8, 9 og 10. D1→D4 are the error signals from the photodetector circuits. When in servicing position 2 the disc is moved, the focusing unit should keep the laser beam in focus. When the disc is moving, there should be a changing signal on pin 7, 8, 9, 10.						
3	HF (High Frequency). HF information fra de 4 fotodioder. HF information from the 4 photodiodes.						
27	HF out (High Frequency out). HF out er et forstærket informationssignal til decoderen. *Efter lead-in er læst. HF out is the amplified information signal for the decoder. *After lead-in has been read.	B (Stable)			B (Unstable)	B* (Stable)	
26 19 18	DET (Detector). HFD (High Frequency DETECTOR). TL (Track Loss). DET giver information om HF signalets niveau til niveau/drop-out detektoren i 30IC6101. Når HF signalets niveau er for lavt, vil HFD gå »low«. TL vil så gå »low« som information til 31IC6301 om at sporings signalerne er upålidelige. DET gives information on the level of the HF signal to the level/drop-out detector in 30IC6101. When the level of the HF signal is too low, HFD will go 'low'. TL will then go 'low' in order to tell 31IC6301 that the tracking signals are unreliable.						
11 12	RE1 (Radial Error). RE1-2 er styresignaler til sporing af laseren. RE2 RE1-2 are the control signals for the arm during tracking.					J	
25	SC (Start Capacitor). *Stiger til +5 V hvis focus punktet er fundet. *Rises to +5 V if focus point is found.		-5 V	*	+5 V	+5 V	
6	FE lag (Focus Error). *Når pladen bevæges, vil signalet variere. *When the disc is moved by hand, the signal will vary.			*	Approx. 100 mVpp		
13	AGC. *Ved maksimum HF signal ≤ -400 mV. Ved ingen HF signal +5 V. *At maximum HF signal ≤ -400 mV. At no HF signal +5 V.	*	»High«	»High«	*	*

ISOLATIONSTEST

Ethvert apparat **skal** isolationstestes efter at det har været adskilt. Testen udføres når apparatet igen er helt samlet og klar til udlevering til kunden.

Isolationstesten udføres på følgende måde:
De to stikben på netstikket kortsluttes og tilsluttes en af terminalerne på isolationstesteren. Den anden terminal fra isolationstesteren tilsluttes en af de to skruer, der er placeret på kølepladen på bagsiden af apparatet.

OBS!

For at undgå beskadigelser på apparatet er det vigtigt, at begge terminaler fra isolationstesteren har virkelig god mekanisk kontakt.
Der drejes nu langsomt med spændingsreguleringen på isolationstesteren indtil en spænding på 1,5-2 kV er opnået. Her skal den holdes i 1 sekund, derefter drejes der langsomt ned for spændingen igen.

Der må ikke på noget tidspunkt under testen forekomme overslag.

INSULATION TEST

Each set **must** be insulation tested after having been dismantled. The test is to be made when the record player has been reassembeld completely and is ready for delivery to the customer (with the transis screws tightened).

Make the insulation test as follows:
Short-circuit the two pins of the mains plug and connect one of the terminals of the insulation tester. Connect the other terminal of the insulation tester to one of the two screws placed on the heat sink on the back of the unit.

NOTE!

To avoid ruining the set it is essential that both insulation tester terminals are in really good mechanical contact.
Now slowly turn the voltage control of the insulation tester until a voltage of 1.5-2 kV is obtained. Hold it there for 1 second, then turn the voltage down again.
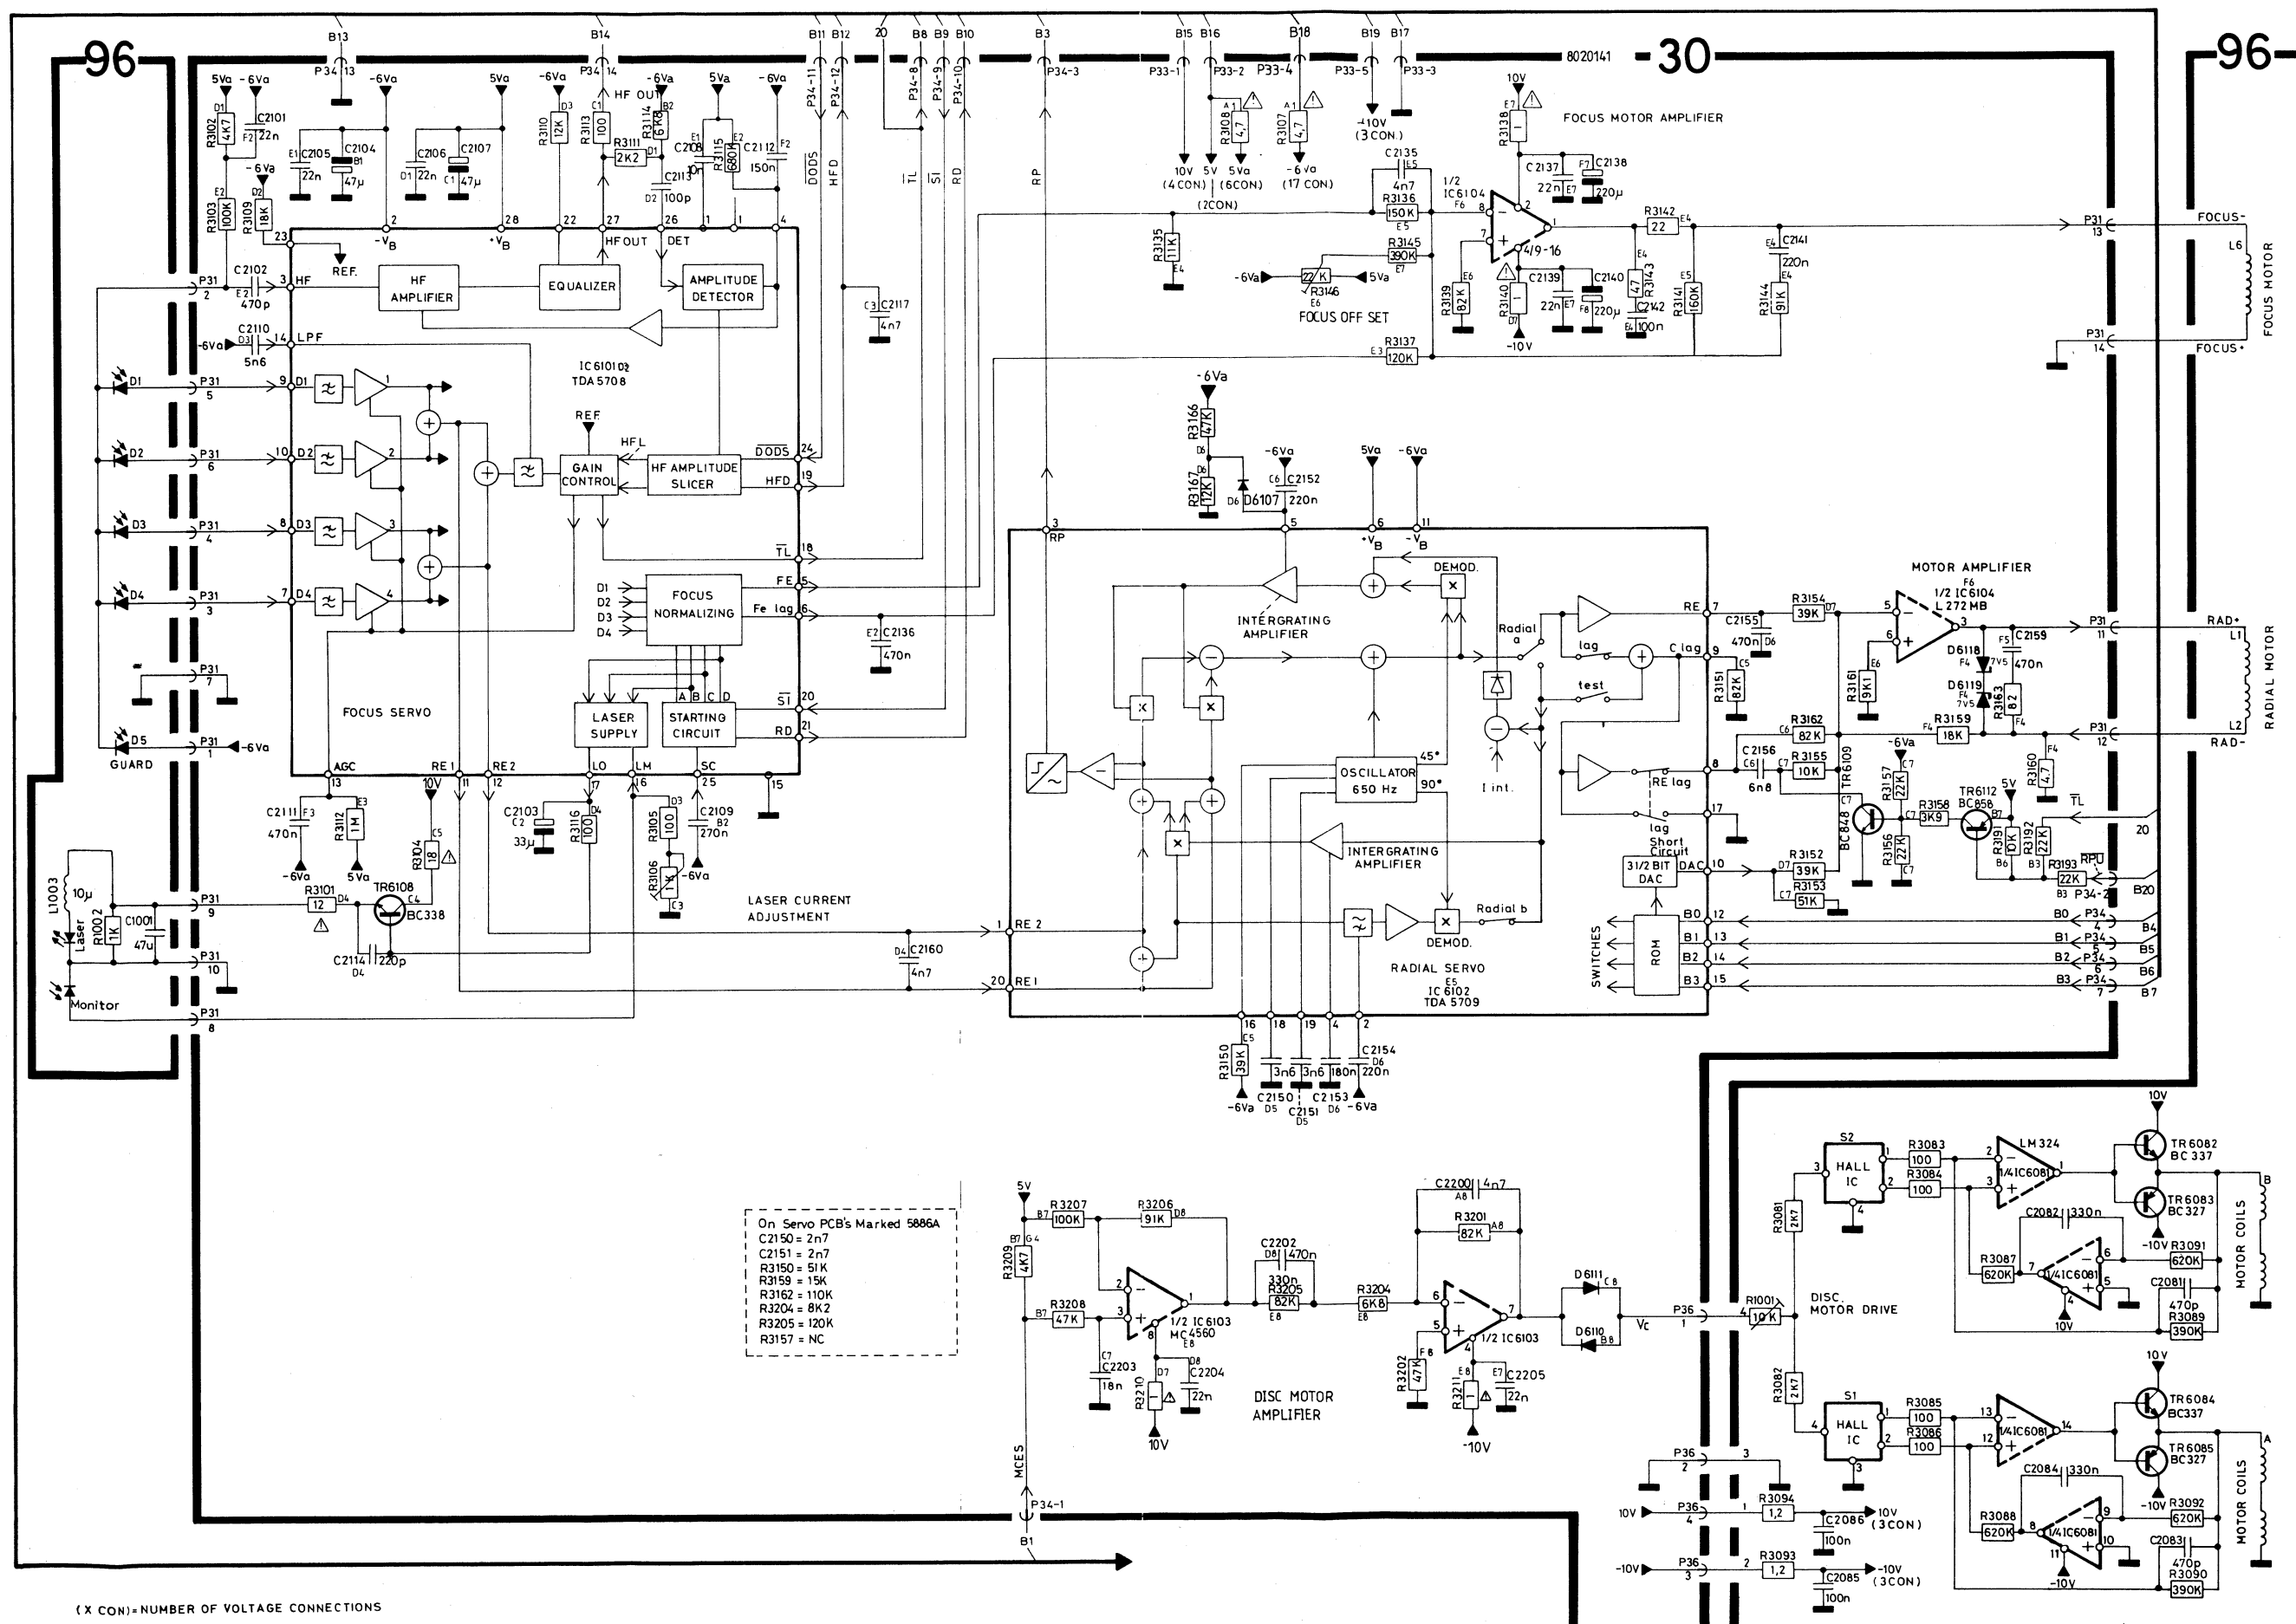

**At no point during the testing procedure any flashovers are permissible.**

△ betyder at statisk elektricitet kan ødelægge komponenten.
△ indicates that static electricity may destroy the component.
△ bedeutet, daß statische Elektrizität die Komponente zerstören kann.
△ signifi que électricité statique peut detruire le composant.

Justering af Focus offset (er ikke muligt i de først producerede apparater).

Ilæg testplade 5A (bestillingsnr. 3634031).

Sæt apparatet i serviceposition 2 ved at kortslutte ben 4 på 36IC6078 til stel samtidig med at netstikket sættes i.

Tryk derefter »ADVANCE« 2 gange.

Hvis displayet bliver ved med at vise »F2«, justeres 30R3146 til displayet viser »02«.

Sæt apparatet i serviceposition 4 ved at trykke »ADVANCE« 2 gange (».4« i displayet skal lyse, og pladen skal rotere).

Tilslut DC voltmeter over 30C2136.

Juster 30R3146 til der måles 400 mV ±40 mV.

Adjustment of DC focus offset (not possible in the first productions of the unit).

Load test disc 5A (order no. 3634031).

Set unit to service position 2 by short-circuiting pin 4 on 36IC6078 to chassis while inserting the mains plug.

Then press "ADVANCE" twice.

If the "F2" on the display keeps flashing, adjust 30R3146 until the display shows "02".

Set the unit to service position 4 by pressing "ADVANCE" twice. (".4" on the display should light and the disc rotate).

Connect DC voltmeter across 30R2136.

Adjust 30R3146 until the reading is 400 mV ±40 mV.

Justierung der Gleichstrom-Fokusfehlverschiebung (in den ersten Produktionen des Gerätes nicht vorhanden)

Die Testplatte 5A einlegen (Bestell-Nr. 3634031).

Das Gerät durch Kurzschließen des Steckers 4 auf 36IC6078 zum Chassis bei gleichzeitigem Einstecken des Netzsteckers in Service-Position 2 bringen.

Anschließend zweimal „ADVANCE" drücken.

Wenn „F2" im Anzeigefeld weiterhin blinkt, 30R3146 einstellen, bis „02" aufleuchtet.

Das Gerät durch zweimeliges Drüken von „ADVANCE" in Service-Position 4 bringen. („4" im Anzeigefeld muß aufleuchten und die Platte rotieren).

Über 30C2136 Gleichstrom-Spannungsmesser anschließen.

30R3146 einstellen, bis 400 mV ±40 mV abgelesen werden können.

Réglage de l'erreur de concentration cc (cette possibilité n'existe pas dans les premiéres productions de l'appareil).

Introduire le disque d'essai 5A (no. de commande 3634031).

Mettre l'appareil en position de maintenance 2 en courtcircuitant la fiche 4 de 36IC6078 pour châssis et enficher simultanément la fiche secteur.
Appuyer ensuite deux fois sur «ADVANCE».

Si le «F2» du visuel continue de clignoter, régler 30R3146 jusqu'a ce que le «02» émette une lumiére continue.

Mettre l'appareil en position de maintenance 4 en appuyant deux fois sur «ADVANCE». (Le «.4» du visuel doit s'allumer et le disque doit tourner).

Raccorder le voltmétre cc sur 30C2136.

Régler 30R3146 jusqu'à obtenir une lecture de 400 mV ±40 mV.
